## Farmers aren't seeking help for mental health: Their partners tell us

Caitlin Vayro, Charlotte Brownlow, Michael Ireland, Sonja March.

## INTRODUCTION

- Queensland farmers suicide rate twice that of metropolitan population (Arnautovska et al., 2014).
- Many factors place demand on farmers (e.g. finances, economics, weather and isolation) and may be distressing (Hossain, Eley, Coutts, & Gorman, 2008).
- Mental health help-seeking is reportedly lacking in farmers and it is unclear why.
- Mental health help-seeking is seeking help from health professionals for issues relating to mental health or distress (Rickwood & Thomas, 2012).
- Farmers' partners may have roles in mental health help-seeking such as facilitation and support.
- This research utilised farmers' partners insight to explore the barriers and facilitators of mental health help-seeking in farmers.

## **METHOD**

- Partners of QLD farmers
- Qualitative
- Semi-structured interviews (N=10)
- Thematic analysis (Braun & Clarke, 2006)

**RESULTS & CONCLUSION**  Weather, especially the current drought, is a large source of farmers' stress, influencing their business Weather and finances. Finances are a major stressor for farmers and may also have a role in preventing mental health helpseeking. Finances • "The fact that if they have had to go, say 500km to get mental health assistance, that's a financial burden."[Albert, F]. Farmers are time poor, production and business are their priority. Farming Farming is a lifestyle and way of life, that is ingrained in their identity. Life/Culture Farming culture may benefit the business, but also potentially prevents mental health help-seeking. Farmers' mental health knowledge is slowly improving, although their understanding is often lacking. Mental health • Farmers are poor at recognising mental health issues within themselves, and are often unable unwilling to literacy acknowledge they need to seek help Mixed reports regarding prevalence of stigma and different types such as self-stigma and public stigma. Stigma of mental-illness as well as stigma of mental health help-seeking reported to have influence. Stigma • "I guess that falls under the stigma umbrella too. I mean they wouldn't want to be seen walking in to the psychologist's clinic"[Susan, F] The support that farmers receive from their partners is important and has the possibility to prevent or facilitate mental health help-seeking. Mental health help-seeking can be facilitated by the partner, such as indicating the need to seek help, or attending the appointment. A variety of coping mechanism (positive and negative) are used including: withdrawing, working more, Coping drinking alcohol, taking a break and using humour. Coping mechanisms may reduce the need to seek help for mental health or alternatively, prevent mental Mechanisms

health help-seeking with no reduction in distress.

Health Services

- Many issues surround the provision of health services for farmers, which may influence their mental health help-seeking
- Issues reported: availability and access, continuity of care, confidentiality, privacy, farmer's relationship with practitioner, distrust of medical care and preference for 'bush' practitioners.

Conclusion

- Farmers partners offer valuable insight in to the mental health help-seeking of farmers
- The findings allow further research on the relative influence of these factors on mental health helpseeking
