## Abstract

Inefficient parking practices have costs associated with them that extend well beyond lost profits and frustrated customers. This dissertation focuses on why parking providers appear hesitant in adopting Intelligent Parking Technology (IPT) that could help benefit all stakeholders. More specifically, this dissertation analyses the following question:

*Why do parking providers appear reluctant to adopt intelligent parking technologies?*

Intelligent Parking Technology (IPT) potentially offers drivers many benefits including faster parking times, more convenient payment options and safer parking lots. For parking providers, benefits of IPT implementation might include higher profits realized through increased business process efficiencies such as automated payment collection. Society could potentially benefit from IPT through primary effects such as reduced traffic congestion, greenhouse gas emissions and driver frustration levels. It may also benefit through secondary effects where, for example, a government uses profits realized through increased efficiencies and spends it on things that will benefit the community such as better roads and more green spaces.

We define Intelligent Parking Technology (IPT) as technologies that are managed by a parking service provider and add value by adapting themselves to whatever a parking situation may be. Intelligent Parking Technology (IPT) includes those technologies that offer a unique functionality such as giving customers the ability to pay for parking using their cellular telephone (m-commerce), automatically directs them to empty parking spaces or automates payment via smart cards.

The parking providers investigated include businesses, schools, and governments. We consider technologies currently available to them as well market willingness to adopt them.

The Delphi technique is used and consists of interviewing independent content experts such as parking services managers within various organizations. We also interview one senior level manager working for a company that licenses or sells Intelligent Parking Technology (IPT). Questions formulated from these interviews are then brought forward and

used in surveying drivers. Data is collected from the surveys and then analysed and interpreted through discussion with the independent content experts initially interviewed so that they may corroborate or disapprove the findings. Their interpretations of the data are also considered in the study, as this research is primarily qualitative in nature.

The driver survey included questions that explored the perceived value drivers might get from different parking technologies currently available to parking providers. Findings from the driver surveys clearly show that drivers are more than willing to adopt Intelligent Parking Technology (IPT).

In every case, the majority of drivers indicated that they would get at least some value from the specific parking technologies presented. This varied from a low of 60.9 percent of respondents indicating they would get value from a robotic parking system to a high of 94.7 percent indicating they would receive value from a system that would direct them to empty parking spaces.

Over 66 percent of drivers also stated that they would be willing to pay more for a parking space if Intelligent Parking Technology (IPT) added value for them.

The senior manager from the parking technology company was not at all surprised by the driver survey results. Parking providers, on the other hand, seemed somewhat surprised by the survey findings and the follow-up interviews where these findings were discussed seemed to initiate a state of reflection for them.

Keywords: Parking Technology, Adoption, Diffusion,

## **Certification of Dissertation**

I certify that the ideas, experimental work, results, analyses, software and conclusions reported in this dissertation are entirely my own effort, except where otherwise acknowledged. I also certify that the work is original and has not been previously submitted for any other award, except where otherwise acknowledged.

## **Acknowledgements**

I would like to give a sincere thank you to Dr. Jeffrey Soar and Dr. Aileen Cater-Steel for their sincere support, patience, encouragement and guidance. I am also grateful for the contributions of Dr. Ronel Erwee and all staff at USQ I have been in contact with. They have all worked as an empathetic and cohesive unit to make my experience at USQ a positive one.

The administration at the MacEwan School of Business – Grant MacEwan University also deserve recognition for not only giving me a stable teaching/research position that I truly enjoy, but also for their genuine encouragement and support for me pursuing this doctorate degree.

My peers deserve special thanks for their support. They have consistently answered my questions in a straightforward and honest way. I appreciate this very much.

Special thanks go out to those I interviewed and surveyed. Your time to help advance this research has not gone unnoticed. I only hope that your participation in this research is someday awarded with a realization that you helped make the world a better place or at least that someday soon you will be able to find your parking space quicker.

And last, but not least, I thank my family. My wife Lori and two children Christiane and Daniel deserve special mention for their unwavering support and belief in me. That is appreciated more than they will ever know.
